

- Project MVP (Kaplan)  
By Ahmed Aloliwi:

At first, I forgot to mention in the proposal the number of the rows and the features in my data source.

I basically, relied on a file containing **1,906 rows** of data, which I worked on for the necessary cleaning. In addition, there will be **four features** it will help me to predict the price for the property.

#### ➤ Analysis of property prices in Dubai City:

##### Price analysis

```
➤ count      1.905000e+03
➤ mean       2.085830e+06
➤ std        2.913200e+06
➤ min        2.200000e+05
➤ 25%        8.900000e+05
➤ 50%        1.400000e+06
➤ 75%        2.200000e+06
➤ max        3.500000e+07
➤ Name: price, dtype: float64
```

Looking at above descriptive analysis for property pricing in our dataset, we can say that:

- Property prices ranging from AED 220,000 to 35 Millions
- We have 1906 total properties in our dataset
- Mean price of our apartment is little over 2 Million AED

Our price distribution looks like:

In this plot, we note the more bathrooms and bedrooms, the higher the property price.

We also note a direct proportion between the quality of the property and its high price.
